

## ***Begonia tuberhybrida*** **Nonstop<sup>®</sup> Joy Yellow**

### ***Culture guide***

**Uses:**

Pots, Hanging Baskets, Mixed Containers and Landscape

**Exposure:**

Partial shade - Shade

**Garden height:**

9" / 23 cm

**Crop time:**

16-18 weeks

**Sowing method:**

Sow 1-2 seeds or pellets per plug.

**Germination:**

Optimum conditions for seedling development, beginning on the day of sowing until radicle emergence. Expect radicle emergence in 7-10 days.

**Fertilization:**

Begin fertilizing early once germination is complete, approximately day 14. Lower rates of feeding at 50 ppm 2-3 times per week will help to size up the seedlings. Under higher light conditions use a 20-10-20 fertilizer and under lower light a 17-5-17. Once seedlings are established the 17-5-17 fertilizer works well. Include a micro nutrient package to give adequate supply of minor elements.
