

Tagetes erecta ***Discovery™ Mix (incl. Gold and Primrose)***

African Marigold

Culture guide

Uses:

Bedding, border, mixed container, summer pots

Exposure:

Sun

Garden height:

9" / 23 cm

Crop time:

8-10 weeks

Sowing method:

1 seed per plug

Germination:

Stage I : 2-3 days at 72-75 °F (22-24 °C). Sow in media with very low soluble salt levels and pH 6.0-6.5. Cover seed lightly with vermiculite after sowing to maintain moisture levels. Keep soil slightly moist but not wet. Light is not required for germination. At the end of stage I the radicle will have emerged and the cotyledons begin to unfurl.

Growing On:

4-5 weeks after sowing transplant 1 plant into 10 cm (4") pots or packs. Transplant African Marigold plugs before they become root bound. Delays in transplanting may induce premature flowering.

Media:

Use a well-drained, disease free, soilless medium with a pH of 6.2 -6.5; do not allow to fall below 6.0 or Iron or Manganese toxicity may result.

Temperature:

18-23 °C (64-73 °F) days, 13-18 °C (55-64 °F) nights. Temperatures that are too low are a cause for a poor quality of the first flowers, too high temperatures encourage flower heads to be reduced in size. Plants for early selling should be hardened slowly at 10-13 °C (50-55 °F). *T. erecta* does not tolerate frost.

Fertilization:

Moderate fertilization levels are required. Fertilize the crop weekly with 150-200 ppm nitrogen, using a complete balanced fertilizer. Avoid high ammonium and high nitrogen levels. High nitrogen levels cause leaves being too large. Check regularly pH value in substrate, because pH below 6.0 can cause necrotic spots on the leaves or yellow leaves.
