

Lobelia speciosa F? Fan® Scarlet

IMPROVED

Item no.: R3110P

Crop Time

Spring: 18 - 20 weeks

Height

60cm

Exposure

Sun - Partial shade

Seed Form

Pelleted Seed

Hardiness Zone

6-10

Best Uses

Bedding, Cutflower, Landscape

Culture guide

Usage

Perennial for border and cottage garden, container plant, bedding, cut flower plants

Sow time

January-March for flowering in pots from July onwards, August-October for flowering in pots the following year, April-May for cut flower production outdoors

Sowing method

1 seed per plug for short day conditions 3-5 seeds per plug for long day conditions, because in long day the plants do not form a leaf rosette.

Germination

10-14 days at 70 °F (21 °C), do not cover seeds, maintain high humidity

Growing on

Transplant plugs after 10 weeks. Transplant one plant into a 4-6" (10-15 cm) pot, or 2-3 plants in a 6" (15 cm) or larger container. Apply a well balanced fertilizer every 2 weeks. Grow on at 60-65 °F (15-18 °C). Vernalization is not required for flower initiation.

Media

Use a well-drained, growing perennial substrate with 0-15 % clay, 1-1,5 kg/m³ complete balanced fertilizer, 2-3 kg/m³ slow release fertilizer (3-9 months), iron-chelate, micronutrients, pH: 6.0-7.0. Field: humus, sandy humus soils with a good drainage. Standard fertilization: 80-100 g/m² of a slow release fertilizer.

Temperature

Grow at 15-18 °C, later decrease the temperature to 10-15 °C when the roots development in pots should be very good. Cultivation outdoors is possible, too. In winter indoors frost free at 3-5 °C or outdoors. Outdoors fleece cover needed. *L. speciosa* are very sensitive to strong frost temperatures. In spring the plants start to grow at 15-18 °C and long day. Cold temperatures at 10-12 °C will increase the cultivation time. A chilling period (vernalization) for flower initiation is not required.

Stage I Starts with the radicle breaking through the testa. The roots are touching the medium. Ends with fully developed cotyledons.

Stage II Starts from fully developed cotyledons. Ends with the fully developed true leaf or true

leaf pair.

Stage III Starts from the fully developed true leaf or true leaf pair and ends with 80% of the young plants being marketable.

Stage IV All young plants are ready for sale and in the process of being hardened off. This stage lasts about 7 days.

The cultural recommendations are based on results from trials conducted under Central European conditions. Different conditions in other parts of the world may lead to deviations in results achieved.
