

Solanum lycopersicum L. Gardener's Delight

Item no.: P9971

Crop Time

Spring: 10 - 12 months

Height

80cm

Exposure

Sun

Seed Form

Raw Seed

Best Uses

Bedding

Culture guide

Usage

Vegetables, pot and container plants

Sow time

Mid February-April for green pots

Sowing method

2-3 seeds per plug

Germination

7-12 days at temperatures of 70-75 °F (21-24 °C). Cover seed lightly with vermiculite after sowing.

Growing on

Transplant plugs after 6-7 weeks. Grow on at 62-65 °F (16-18 °C).

Media

Use a well-drained, growing substrate with 15-30 % clay, 0-15 % parts (e. g. perlite, sand), 3 kg/m³ complete balanced fertilizer, iron-chelate, micronutrients, pH: 5.8-6.5.

Temperature

Grow at 17-20 °C. Lycopersicon does not tolerate temperatures below 5 °C. Therefore protect the young plants against cold night temperatures. The plants should be hardened for early selling.

Stage I Starts with the radicle breaking through the testa. The roots are touching the medium. Ends with fully developed cotyledons.

Stage II Starts from fully developed cotyledons. Ends with the fully developed true leaf or true leaf pair.

Stage III Starts from the fully developed true leaf or true leaf pair and ends with 80% of the young plants being marketable.

Stage IV All young plants are ready for sale and in the process of being hardened off. This stage lasts about 7 days.

The cultural recommendations are based on results from trials conducted under Central European conditions. Different conditions in other parts of the world may lead to deviations in results achieved.
