

Dichondra argentea

Silver Surfer™

Item no.: DA0101T

- Reliable BeGreen seed treatment from Benary
- Outstanding root development for faster growth
- Strong performance under hot and dry conditions
- Excellent choice for hanging baskets and mixed containers
- Optimal storage: up to 6 months at 5 °C / 41 °F

Crop Time	Spring: 12 - 14 weeks
Height ∅	3 " / 8 cm
Width ∅	11 " / 28 cm
Length	59 " / 150 cm
Exposure	Partial Sun - Sun
Seed Form	BeGreen ApeX
Product Use	Hanging Baskets, Mixed Containers, Bedding
Family, Origin	Convolvulaceae, North & Central America
Minimum Germ. Rate	85%

TECHNICAL GUIDE

Dichondra argentea Silver Surfer™

Plug Culture

Germination: Maintain optimum conditions for seedling development, beginning on the day of sowing until radicle emergence. Expect radicle emergence in 6-8 days.

Cover: Important - The seeds should be covered by a thin layer of vermiculite or substrate to maintain moisture and humidity levels. This is necessary for germination, whereas light is not required.

Sowing method: 1-2 seeds per plug.

Media: pH 5.5-6.3; EC 0.75.

Temperature: 22-24 °C (72-76 °F). For irrigation use warm water (above 18 °C/64 °F) only.

Moisture: Seedlings grow best under warm and dry conditions. Start with the humidity level 4 and lower the level to 2-3 after the radicles have fully emerged.

Fertilizer: Maintain an EC < 0.7. At radicle emergence, apply 50-75 ppm nitrogen from 15-0-15.

Light: In the first stage of plug development light is optional. Then increase the light level up to 10,000-25,000 lx for minimum 14 hours/day. Later on, the seedlings need an intense light up to 55,000 lx.

Temperature: 18-22 °C (64-72 °F) night and day. In the last stage of the plug development, the temperature can be lowered to 17-18 °C (62-64 °F).

Fertilizer: Overall use light feed. 100-175 ppm nitrogen should be used in the second stage of plug development. Maintain an EC between 0.7 to 1.2. Rinse the foliage after feeding to avoid salt burns.

Growth Regulators: No pinching needed. In the early stages no growth regulators are required. Later on, daminozide sprays at 2,500 ppm can be used for plug culture. One week before transplanting, spray 2,500 ppm to promote the branches. Overall, growth regulators are just an option.

Growing On

Media: pH 5.5-6.5; EC 1.2-1.5.

Light: Provide the youngplants 25,000-55,000 lx for at least 14 hours a day after potting. High light levels result in a more intense silver color of the foliage and shorter internodes.

Temperature: Maintain 17-18 °C (62-64 °F) at night and 18-22 °C (64-72 °F) at day in the growing stage.

Moisture: The crop grows best under dry conditions with a humidity level around 2. Avoid waterlogging.

Fertilizer: Moderate fertilization levels are required. Fertilize the youngplants with 175-225 ppm nitrogen, using a complete balanced fertilizer. Maintain an EC between 1.2 to 1.5. Rinse the foliage after feeding to avoid salt burns.

Growth Regulators: Overall, the branching of Silver Surfer™ is fantastic and the cultivation is feasible without any use of growth regulators or pinching. There is the option to spray a single application of 5,000 ppm two weeks after transplanting to increase the branching of the silvery foliage and to reduce the length for an easier shipment and presentation at retail.

Fungicide: A wet and too cold cultivation can lead to Botrytis and Phytophthora infections.

Common Diseases: Rarely downy-mildew.

Pests: No vulnerability.

Plug & Finished Crop Time

Plug Crop Time

288 tray: 5-6 weeks

Finished Crop Time (from 288 tray)

10 cm (4") pots (1*): 6-7 weeks

15 cm (6") pots (3*): 7-8 weeks

25 cm (10") pots (5*): 7-9 weeks.

*plants per pot

Expert Tip

Dichondra does not tolerate waterlogging. In any case, a drainage system will help so that the excess water can run off. This silvery star with attractive leaves is a real eye-catcher in mixed plantings and an excellent choice for hanging baskets. It is also suitable as groundcover plant or for indoor use – a true all-round talent!

– **Helen, Product Specialist**

Moisture Codes

Saturated (5) Water is easily observed when finger is pressed on cell. Water moves freely from the top of the plug to the bottom.

Wet (4) Media looks black and is not glistening. The media feels wet to the touch but there is very little water movement.

Moist (3) Water is not easily visible. When finger is pressed on the cell there is very little movement from top to bottom.

Medium (2) Media is not black, but now looks medium brown. There is no water movement when pressed with finger.

Dry (1) Media has changed color to a very light brown and is dry to the touch.
